Personal Profile

Programmer with over 4 years experience in the games industry. I have a passion for gameplay and UI programming. Proficient in C++, with experience shipping multiple titles. Looking for new experiences within the games industry, highly motivated about solving problems and collaborating across disciplines

Employment

Red Rover Interactive

Apr 2025 ~ Oct 2026

Senior Gameplay Programmer

Oct 2025 ~ Oct 2026

Gameplay Programmer

Apr 2025 ~ Oct 2025

Worked on **Enginefall**, a multiplayer PVP survival crafting/extraction game.

- Owned and implemented multiple systems. As part of this, handled scoping out the features, giving feedback on design, and iterating on them from player feedback.
- Implemented a tech tree system and UI which supported both individual and shared progression across multiple tech trees. The UI was built to handle large numbers of individual nodes.
- Created a world marker system which handled data from objects within the game for use on an in-game compass and map. This involved tracking various dynamic and static sources.
- Improved building system; refactored to support prefabs (collections of building pieces), made placing objects easier and refactored build zones to improve UX for design.
- Helped teach the wider programming team about UI, offering advice and solutions in addition to preparing and delivering presentations to give them an overview of UI in Unreal.

Sumo Newcastle

May 2022 ~ Mar 2025

Gameplay Programmer

Jan 2024 ~ Mar 2025

Graduate Programmer

May 2022 ~ Jan 2024

Worked on **Critter Cafe**, a single-player critter collecting, cafe management cozy game.

- Implemented multiple gameplay mechanics to a high-standard in C++, these include: character's tools, level ingredients(blocks/redirectors/switches), cafe open for trade + minigame, UI.
- Created these mechanics from a specification, and worked collaboratively with designers & level designers to iterate on them and develop tooling to solve workflow issues.
- Responsible for reworking the customisation mode to improve the game feel and UX.
- Experience gained with fixing bugs and debugging across a complex game with data used across a variety of places, such as save data or global game data.

Worked on **DeathSprint 66**, a multiplayer, high-speed on-foot racing game.

- Prototyped gameplay systems and mechanics within a small feature team, iterating on these to find the fun and moving on once we were satisfied with the outcome.
-

Personal Projects

Rendering Project (C++ / Vulkan)

2025

- Ported the rendering portion of my game engine to gain more experience with C++ (without Unreal)
- Implemented basic SSAO and created my own format that I could serialize assets into. This is so that they were optimised for the data formats within my project and easier to load at run-time.

Game Engine (Rust / Vulkan)

2022 ~ 2023

- Consisted of a renderer, simple asset management, collision detection and other utilities
 - Implemented lighting, shadows, post-processing, instanced rendering, compute shaders
 - Created a renderlist that used virtual resources to abstract away render passes
-

Technical Skills & Qualifications

- 4 years industry experience using C++/Unreal Engine/Perforce
- MComp Computer Science (Games Engineering) Newcastle University, UK (1st)
